Quantitative renal Doppler ultrasound measurement of endothelial response to continuous renal replacement therapy. Continuous renal replacement therapy (CRRT) improves hemodynamics, electrolyte balance, acid-base balance, and survival in critically ill patients with acute renal failure. However, the endothelial damage which may occur during CRRT has not been quantified. To investigate endothelial injury during CRRT, brachial artery diameter and blood velocity waveforms were measured using continuous wave Doppler ultrasound in 5 critically ill patients with acute renal failure receiving either continuous venovenous hemofiltration (CVVH) or continuous venovenous hemodialysis (CVVHD). Between continuous arterial blood sampling and ultrasound measurements, samples were taken for blood gas analysis. Of the arterial blood samples, 99-100% of those taken between the ultrasound measurements were within the normal reference range for pH, P(CO(2)), and P(O(2)). Renal blood flow increased in all patients. There were no significant changes in brachial artery diameter or mean blood velocity. Arterial partial pressure of oxygen remained constant; however, partial pressure of carbon dioxide increased in all patients. Mean arterial blood pressure decreased significantly. We conclude that continuous CRRT increases blood flow, but does not change endothelial function in critically ill patients with acute renal failure.

Q: Split columns based on regexp
I have a table with columns which are made up of date, time, a string (which is not always the same) and I want to put the time in a new column and only keep the time part of the string. The time is 10:00-16:00. Is there a way to split columns based on the number of digits in the string? Example:
Type Date Time String ----- Type 12/31/2014 12:00:00 ... Type 12/31/2014 12:15:00 ... Type 12/31/2014 12:30:00 ...
Type 12/31/2014 12:45:00 ... Type 12/31/2014 12:54:00

A pilot study of the use of ultrasound in the assessment of posterior cruciate ligament tears: a review of the current literature. The clinical diagnosis of a posterior cruciate ligament (PCL) tear has traditionally been based on a physical examination. With the advent of magnetic resonance imaging as a technique in diagnosing PCL tears, it has led to the development of new classification systems. Ultrasound is a non-ionizing radiation-free imaging technique that has demonstrated limited diagnostic ability in the examination of the knee. The anatomy and biomechanics of the PCL have been well described using ultrasound. Given these characteristics, the application of ultrasound as an imaging tool in the diagnosis and management of PCL tears has been studied by some authors. The present study aims to review the literature and highlight the current evidence of the application of ultrasound in the diagnosis of PCL tears.
