Q: Make It Possible to Commit and Push in multiple revision in Git I'm not a professional Git user, but I'm getting into it for work purposes. I know some Git commands, but I'm not an expert. I have a small team working in Git, and we are

---

using a working directory called "progress". It is used to share information among developers for internal reviews. The git repo is a private repo, and we have not decided yet on what the branch name should be, I will let our Git master know as soon as we have decided on it. My problem is that I do not want to loose any work.

When I go through a review process, I can see all my progress and have only a selected amount of changes. Here's my workflow:

---

I create a working dir called "progress". I create my branch called "one". I modify some stuff and make sure it is working I commit. I make sure it is working I revert back to the last commit I make changes to my branch "one" I commit I change the name of my branch to "two" (I don't want to loose any history, but I don't care about the order of the commits) I commit I change my branch back to "one" I go to my branch "one" and start modifying

---

I make some modifications and commit I go to my branch "two" and start working on something else At this point I stop my work in progress and revert back to the latest commit. I continue working in my branch "two". I make some changes, and commit. My problem is this: I don't want to start all over at the beginning of my "two" branch. I want to continue where I left off before I stopped working on it, because my "one" branch is not
