session on the Canadian tech startup ecosystem that introduced the hosts, CBC's Marketplace, to Torontonians on Monday night. Marketplace's hosts Julie Crysler, John Doyle and Jen Brown were on hand to interview local entrepreneurs, investors and the CBC's own ReachOut.tv's Paul Tichy. The panel was moderated by Marketplace's Jordan Valinsky.

"Let's just start with the way that Canada's economy is ... we don't really produce our own content," said Crysler, noting that we export 90 per cent of everything we make. "We take all the investment and the investment comes from elsewhere so you don't really have a 'homegrown' economy." The panel suggested Canada is treated as a test market for Silicon Valley, as a place to let companies try out new products. Ideas that have worked elsewhere don't work in Canada, they said, because we're not trying those same concepts. "We have the best idea of what it is to be a startup," said Tim Rumpf, founder of Gilt Groupe. "But it's not happening here. I want to do it in Canada." Jag De, founder of Bold Capital, ran a startup in Silicon Valley for three and a half years. Now, Bold Capital invests in Canadian tech startups. He brought a different view to the panel. "I'm at the point in my life that I'm now looking to Canada and Mexico as the next place to launch," he said. "Not the U.S." He cited Canada's much lower cost of living as a cost

advantage and added that it also attracts talent. "I just invested \$6.5 million in my third company in Canada," he said. "I'm a citizen of Canada because I like it here." David Coburn of Zencor, a software development company working with the military, said he chose Canada over the

Q: Accelerating an already accelerated quadratic function I have a quadratic function which I can accelerate to a certain degree using inverse-time differentiation and then raise to a higher degree by Newton's method (which is accurate to two decimal places). The acceleration function is increasing and my Newton's method is working fine for small values but for large values (say 200), Newton's method is taking more time to converge. Is there a way I can accelerate this further in the Newton's method approach without affecting the cost? For example: $y = y_{old} + (y_{old} * y_{old} * t) / (2 * t)$

A: Assuming that $y_0 = y_1 = \dots = y_k = 0$, $t \rightarrow \infty$, and $y_k \approx y$:

$$y = \frac{y_k^2}{2} t^2 + y_k \sqrt{t^2 - 4} \tan^{-1} \sqrt{t^2 - 4} + \mathcal{O}(t^4)$$

Image caption There have been protests over 5G plans in cities such as Frankfurt Germany's government will be asked to make changes to 5G spectrum
