Inserting slits involves the insertion of at least three (in some cases four) slits (usually crossed) running through the design. When the design is viewed from below through the thick end of the pencil DLC the effect of the slits is to reveal hidden parts of the design. This effect can also be seen when a design is viewed from above, through the thin end of the pencil, due to the light passing through the slits. Inserting slits can be used for a number of purposes and can be incorporated into a variety of designs. The shapes and forms within which slits are created can vary, even within a single design, but the most common forms are circles, squares, triangles, diamonds and rectangles. Designs in which slits are incorporated are also commonly used as a technique for masking off features on an otherwise flat surface. A very popular use of inserting slits is as a method for adding backgrounds to artwork. Because inserting slits is a sofisticated technique it can be a time consuming and expensive undertaking for designers and their clients. Designs for inserting slits need to be drawn on a large sheet of paper with the slits crossing at 45 degree angles. Once the sheet of paper is cut out the slits are then inserted into the design. Inserting slits is often a problem-solving technique, adding visual interest and texture to a design. The use of inserting slits adds variety and interest to a design and can in most cases help to disguise aspects that would otherwise be difficult to place. One of the most notable changes is the rising number of pedestrians killed while the traveling public is legally waiting in transit. Figures from the National Highway Traffic Safety Administration (NHTSA) paint a grim picture of these deaths; they report that from 2001 to 2011, for every 50,000 passengers waiting at a bus stop or transit stop, 2.3 pedestrians

were killed while the traveling public is legally waiting. Since 2001, pedestrians have increased by nearly a third to 6,961 deaths and 21,771 injuries. The fate of a pedestrian in the United States is governed by the right-of-way (ROW) principle. If a vehicle is operating in a single lane, pedestrians are presumed to have the ROW. If there are more lanes, the motorist has the ROW. If there is any ambiguity over which vehicle has the ROW, the pedestrian is presumed to have the ROW. Almost all pedestrian deaths occur in urban areas. This is because most urban areas have well-defined pedestrian traffic patterns and paved sidewalks. It is often easier to cross an urban area without running a risk of being hit by a motorist. As a result, pedestrians have the right-of-way almost everywhere. Thus, even in rural areas where a vehicle may have the ROW, it is not uncommon for the motorist to be unaware of the pedestrian. In urban areas, pedestrians are trained to walk in the street wherever it is safe to do so. In contrast, most rural areas are surrounded by farms and other rural land. These 6d1f23a050
