Photoshop has all the features the professional user can imagine. The best feature is the extensive integration with other Adobe™ programs. If you want to edit a source image that comes from a different app, then you just have to open it in Photoshop.

Also, Photoshop has been designed to make editing easier, for example with quick image adjustments, smart-auto-Save and fully integrated direct printing. Adobe Photoshop allows creating designs with layers and multiple editing windows within a single image. A single design can be saved as multiple.psd file versions. This type of workflow is used to create a document and add or modify the page elements while the design is being tested. After that it can be exported into a web page or PDF for printing. Adobe Photoshop also enables users to create a scene changer for a quick workflow. The scene changer empowers designers to reverse the colors, convert the images, script or bring the design into a new scene without any preliminary changes.

We expect the web designers will appreciate the versatility of changes made with layers. They can continuously modify changing the items they are interested in. They can also effortlessly copy and move items. Designers can even save their work at any stage and work on an always updated web design version, they only have to export to a web page or PDF and then print.

The new sketching feature within Photoshop is announced to be ideal for designers. With the new vector-based drawing tools, it helps in creating a design with vector-based drawing. It also speeds up the creation process by allowing you to draw easily on top of the previous design (e.g., a website logo, letterhead, or social media post) as a mobile sketch that can be easily converted into real artwork. The new files are brought up fast and can be edited simultaneously, which also provides the resulting design to be more accessible to non-traditional design software.
