The new CSS features for elements like layers and paths are cool. I don't know when I will actually use them, but they are opening up potential for more custom styles. Adobe says that they will be including support for CSS3 features for elements like blending modes and gradients in the near future. One of the things that bothers me the most is the way that the Actions panel is displayed. It's small and at first it looks like it's running in an independent instance of Photoshop. Eventually, to use the plug-ins you have to drill in and out, and it becomes annoying. There are just too many things in the panel and it is hard to find any of them at first. Also, the key commands for Action plug-ins like "Loop" and "Layer" are all in the Edit menu. This is very confining and limits your ability to quickly edit your images. Hopefully, Photoshop CS6 will have a more intuitive Actions layout. I have been a devoted user of Photoshop since the beginning. I grew up with it and spent thousands of hours in front of it creating the images for the hundreds of layouts I have created over the past few decades.

The first version that opened my eyes to the future of the industry was the Photoshop 1.0 released in 1991. My first job in New York City was a photographer who was a client of ours. When I started, he was already using Photoshop and he taught me how to use it. I then spent years experimenting with the program. It was my first experience with digital photography. Photoshop was the first publishing app that put graphic designers around the world on equal footing with print artists. It changed the industry and I am grateful to be a part of it.

The only place Photoshop has a meaningful edge over Elements is its full version. However, Elements is still an excellent alternative for those who take their images a step further.
